Superoptimal Preconditioners for Functions of Matrices

Zheng-Jian Bai* Xiao-Qing Jin† Teng-Teng Yao‡

Abstract

For any given matrix $A \in \mathbb{C}^{n \times n}$, a preconditioner $t_U(A)$ called the superoptimal preconditioner was proposed in 1992 by Tyrtyshnikov [20]. It has been shown that $t_U(A)$ is an efficient preconditioner for solving various structured systems, for instance, Toeplitz-like systems. In this paper, we construct the superoptimal preconditioners for different functions of matrices. Let $f$ be a function of matrices from $\mathbb{C}^{n \times n}$ to $\mathbb{C}^{n \times n}$. For any $A \in \mathbb{C}^{n \times n}$, one may construct two superoptimal preconditioners for $f(A)$: $t_U(f(A))$ and $f(t_U(A))$. We establish basic properties of $t_U(f(A))$ and $f(t_U(A))$ for different functions of matrices. Some numerical tests demonstrate that the proposed preconditioners are very efficient for solving the system $f(A)x = b$.

AMS classification: 65F10; 65F15; 65L05; 65N22.

Keywords: Superoptimal preconditioners, functions of matrices, Toeplitz matrix, PCG method.

1 Introduction

Let $U \in \mathbb{C}^{n \times n}$ be a unitary matrix. Define the set

$$\mathcal{M}_U \equiv \{U^*\Lambda U \mid \Lambda \text{ is any } n \times n \text{ diagonal matrix}\}.$$ 

For any $A \in \mathbb{C}^{n \times n}$, the superoptimal preconditioner $t_U(A)$ is defined to be the minimizer of

$$\min \|I_n - W^{-1}A\|_F$$

over all nonsingular matrices $W \in \mathcal{M}_U$, where $\| \cdot \|_F$ denotes the Frobenius matrix norm.

The superoptimal preconditioner was proposed by Tyrtyshnikov [20] in 1992. It was also studied by Chan, Jin, and Yeung [5, 6]. The superoptimal preconditioner was used to solve some ill-conditioned problems appeared in image deblurring [2] and other structured systems [4, 7, 11, 13]. For more useful properties of $t_U(A)$, we refer to [9, 10, 14].

Recently, Jin, Zhao, and Tam study the optimal preconditioners for matrix functions [16]. For any given $A \in \mathbb{C}^{n \times n}$, the optimal preconditioner $c_U(A)$ is defined in [8] to be the minimizer of

$$
\min_{W \in \mathcal{M}_U} \|A - W\|_F.
$$

In this paper, we propose the superoptimal preconditioners for some special functions of matrices. We first recall basic properties of the optimal and superoptimal preconditioners. Here, $\delta(A)$ stands for the diagonal matrix whose diagonal is equal to the diagonal of a matrix $A \in \mathbb{C}^{n \times n}$.

**Lemma 1.1.** [10, 13, 14, 15] Let $A \in \mathbb{C}^{n \times n}$ and $\mathcal{W}(A) = \{x^*Ax : x \in \mathbb{C}^n \text{ and } \|x\|_2 = 1\}$, where $\| \cdot \|_2$ denotes the 2-norm. Then

(i) $c_U(A) = U^*\delta(UAU^*)U$ and is uniquely determined by $A$.

(ii) If both $A$ and $c_U(A)$ are nonsingular, i.e., $0 \notin \mathcal{W}(A)$, then the superoptimal preconditioner $t_U(A)$ exists and is given by

$$
t_U(A) = c_U(AA^*)[c_U(A^*)]^{-1} = U^*\delta(UAA^*U^*)\delta^{-1}(UAU^*)U,
$$

where $A^*$ means the conjugate transpose of $A$.

(iii) If both $c_U(A)$ and $t_U(A)$ are nonsingular, then one has

$$
\sigma_k([t_U(A)]^{-1}A) \leq \sigma_k([c_U(A)]^{-1}A),
$$

for $k = 1, \ldots, n$, where the singular values are in increasing order, $\sigma_1 \leq \sigma_2 \leq \cdots \leq \sigma_n$.

(iv) If $A$ is Hermitian positive definite, then one has

$$
\lambda_k([t_U(A)]^{-1}A) \leq \lambda_k([c_U(A)]^{-1}A),
$$

for $k = 1, \ldots, n$, where the eigenvalues are in increasing order, $\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$.

(v) 

$$
[UAA^*U^*]_{kk} \geq [UAU^*]_{kk} \cdot [UA^*U^*]_{kk} \geq 0,
$$

for $k = 1, 2, \ldots, n$.

In the following sections, we propose two superoptimal preconditioners for some special matrix functions $f$ from $\mathbb{C}^{n \times n}$ to $\mathbb{C}^{n \times n}$: $t_U(f(A))$ and $f(t_U(A))$, where $A \in \mathbb{C}^{n \times n}$ is a given matrix. We discuss properties of both preconditioners $t_U(f(A))$ and $f(t_U(A))$ for different functions of matrices. We also report some numerical experiments for solving the system $f(A)x = b$, where $b \in \mathbb{C}^n$. 
2 Superoptimal preconditioners for functions of matrices

We construct the superoptimal preconditioners for different functions of matrices: matrix exponential, matrix cosine, matrix sine, and matrix logarithm in this section.

2.1 Superoptimal preconditioners for matrix exponential

The matrix exponential function arises in matrix group theory [1], computational mathematics [19], and financial mathematics [17, 18], etc. We study basic properties of the preconditioners $t_U(e^A)$ and $e^{t_U(A)}$. Note that the matrix exponential for a matrix $A \in \mathbb{C}^{n \times n}$ is defined by

$$e^A \equiv \exp[A] \equiv I + A + \frac{A^2}{2!} + \frac{A^3}{3!} + \cdots + \frac{A^n}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{A^k}{k!}.$$ 

By Lemma 1.1 (ii), we have

$$t_U(e^A) = \sum_{k=0}^{\infty} \frac{A^k}{k!} U^* U \left[ \sum_{k=0}^{\infty} \frac{(A^*)^k}{k!} U^* \right] U = U^* \delta(U e^A e^{A^*} U^*) \delta^{-1}(U e^{A^*} U^*) U$$

$$= U^* \delta \left( U \left[ \sum_{k=0}^{\infty} \frac{A^k}{k!} \right] U^* U \left[ \sum_{k=0}^{\infty} \frac{(A^*)^k}{k!} \right] U^* \right) \delta^{-1} \left( U \left[ \sum_{k=0}^{\infty} \frac{(A^*)^k}{k!} \right] U^* \right) U$$

$$= U^* \delta \left( \sum_{k=0}^{\infty} \frac{(UAU^*)^k}{k!} \sum_{k=0}^{\infty} \frac{(UA^* U^*)^k}{k!} \right) \delta^{-1} \left( \sum_{k=0}^{\infty} \frac{(UA^* U^*)^k}{k!} \right) U$$

$$= U^* \delta(e^B e^{B^*}) \delta^{-1}(e^{B^*}) U = U^* \delta(e^B (e^{B^*}) \delta^{-1}((e^{B^*})^*) U,$$

where $B = UAU^*$. We point out that $e^B$ may be computed much more easily than that of $e^A$. In particular, if $B$ is a sparse matrix, then $e^B$ could be computed easily. For example, let $U$ be the $n \times n$ Fourier matrix $F$ and $B$ the $n \times n$ Toeplitz matrix given by

$$B = \begin{pmatrix}
1 & 0 & \cdots & 0 & 1 \\
0 & 1 & 0 & \ddots & 0 \\
\vdots & 0 & 1 & \ddots & \vdots \\
0 & \ddots & \ddots & \ddots & 0 \\
0 & 0 & \cdots & 0 & 1
\end{pmatrix}.$$ 

Then $A = F^* BF$ is a dense matrix compared with $B$. When $n$ is large, the computation of $e^B$ is much easier than the computation of $e^A$.

If $A$ is normal, then there exists a unitary matrix $W$ such that $A = W^* \Lambda W$ where
Lemma 2.1. \( A = \text{diag}(\lambda_1, \lambda_2, \ldots, \lambda_n) \). In this case, \( B = U A^* U = U W^* \Lambda W U^* \). Hence,

\[
t_U(e^A) = U^* \delta(e^B e^{B^*}) \delta^{-1}(e^{B^*}) U = U^* \delta(e^{B + B^*}) \delta^{-1}(e^{B^*}) U,
\]

\[
= U^* \delta(U W^* \text{diag}(e^{\lambda_1 + \bar{\lambda}_1}, e^{\lambda_2 + \bar{\lambda}_2}, \ldots, e^{\lambda_n + \bar{\lambda}_n}) W U^*) \times (2.1)
\]

\[
\delta^{-1}(U W^* \text{diag}(e^{\bar{\lambda}_1}, e^{\bar{\lambda}_2}, \ldots, e^{\bar{\lambda}_n}) W U^*) U,
\]

where \( \bar{a} \) means the complex conjugate of a complex number \( a \in \mathbb{C} \). If \( A \) is Hermitian, then (2.1) turns to be

\[
t_U(e^A) = U^* \delta(e^B e^{B^*}) \delta^{-1}(e^{B^*}) U = U^* \delta(e^{2B}) \delta^{-1}(e^B) U,
\]

\[
= U^* \delta(U W^* \text{diag}(e^{2\lambda_1}, e^{2\lambda_2}, \ldots, e^{2\lambda_n}) W U^*) \times (2.2)
\]

\[
\delta^{-1}(U W^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n}) W U^*) U.
\]

We observe from (2.2) that instead of the series of matrices, we only need to compute the exponential functions. This can largely reduce the cost of constructing \( t_U(e^A) \). Of course, when \( A = W^* \Lambda W \) is diagonalizable, one can easily obtain \( e^{-A} = W^* e^{-\Lambda} W \) and therefore no need to compute the preconditioned \( t_U(e^A) \) from the computational point of view. Hence (2.2) is only for a theoretical analysis later (see Theorem 2.2).

Next, we discuss the preconditioner \( e^{t_U(A)} \). Let

\[
\delta(U A A^* U^*) = \text{diag}(\gamma_1, \gamma_2, \ldots, \gamma_n) \quad \text{and} \quad \delta(U A U^*) = \text{diag}(\eta_1, \eta_2, \ldots, \eta_n).
\]

Then

\[
e^{t_U(A)} = \sum_{k=0}^{\infty} \left[ t_U(A) \right]^k \frac{k!}{k!} = \sum_{k=0}^{\infty} \frac{1}{k!} \left[ U^* \text{diag} \left( \frac{\gamma_1}{\eta_1}, \frac{\gamma_2}{\eta_2}, \ldots, \frac{\gamma_n}{\eta_n} \right) U \right]^k
\]

\[
= U^* \text{diag} \left( \sum_{k=0}^{\infty} \frac{1}{k!} \frac{\gamma_1^k}{\eta_1^k}, \ldots, \frac{1}{k!} \frac{\gamma_n^k}{\eta_n^k} \right) U = U^* \text{diag} \left( \frac{\eta_1}{\eta_1}, \frac{\eta_2}{\eta_2}, \ldots, \frac{\eta_n}{\eta_n} \right) U.
\]

Also, we can see from (2.4) that the cost of constructing \( e^{t_U(A)} \) can be reduced greatly.

We now discuss the bounds for the norm of the superoptimal preconditioners \( t_U(e^A) \) and \( e^{t_U(A)} \). We first give a bound for \( ||t_U(A)||_2 \).

Lemma 2.1. Let \( A \in \mathbb{C}^{n \times n} \). If both \( A \) and \( c_U(A) \) are nonsingular, then we have

\[
\max_{1 \leq k \leq n} |\eta_k| \leq ||t_U(A)||_2 \leq \max_{1 \leq k \leq n} \left[ U A A^* U^* \right]_{kk} \leq \frac{\max_{1 \leq k \leq n} \gamma_k}{\min_{1 \leq k \leq n} |\eta_k|} \leq \frac{\sigma_{\max}^2(A)}{\min_{1 \leq k \leq n} |\eta_k|},
\]

where \( \sigma_{\max}(A) \) means the largest singular value of \( A \), and \( \gamma_k \) and \( \eta_k \) (\( k = 1, \ldots, n \)) are given by (2.3).
Proof. We have by Lemma 1.1 (ii),
\[ \|t_U(A)\|_2 = \|U^* \delta(UAA^*U^*) \delta^{-1}(U^*U^*)U\|_2 = \|\delta(UAA^*U^*) \delta^{-1}(U^*U^*)\|_2 = \max_{1 \leq k \leq n} \frac{[UA^*U^*]_{kk}}{[UA^*U^*]_{kk}} \quad (2.5) \]
Then from (2.5),
\[ \|t_U(A)\|_2 \leq \frac{\max_{1 \leq k \leq n} [UA^*U^*]_{kk}}{\min_{1 \leq k \leq n} [(UA^*U^*)_{kk}]} \leq \frac{\max_{1 \leq k \leq n} \gamma_k}{\min_{1 \leq k \leq n} |\eta_k|} \leq \frac{\sigma^2_{\text{max}}(A)}{\sigma^2_{\text{min}}(A)}. \]
Moreover, by (2.5) again and Lemma 1.1 (v), we get
\[ \|t_U(A)\|_2 = \max_{1 \leq k \leq n} \frac{[UA^*U^*]_{kk} \cdot [(UAU^*)_{kk}]}{[(UAU^*)_{kk}]} \geq \max_{1 \leq k \leq n} \frac{[UA^*U^*]_{kk}}{[UAU^*]_{kk}} = \max_{1 \leq k \leq n} |\eta_k|. \]
\[
\]
On the bounds for \(\|t_U(e^A)\|_2\) and \(\|t_U(A)\|_2\), we have the following results.

**Theorem 2.2.** Let \(A \in \mathbb{C}^{n \times n}\) be Hermitian. If both \(A\) and \(c_U(A)\) are nonsingular, then we have
\[ e^{\lambda_{\text{min}}(A)} \leq \|t_U(e^A)\|_2 \leq e^{2\lambda_{\text{max}}(A) - \lambda_{\text{min}}(A)}, \]
where \(\lambda_{\text{max}}(A)\) and \(\lambda_{\text{min}}(A)\) is the largest and smallest eigenvalues of \(A\) respectively.

**Proof.** Since \(A \in \mathbb{C}^{n \times n}\) is Hermitian, there exists a unitary matrix \(W \in \mathbb{C}^{n \times n}\) such that \(A = W^*AW\), where \(\Lambda = \text{diag}(\lambda_1, \lambda_2, \ldots, \lambda_n)\). Then we have by (2.2) and Lemma 2.1,
\[ \|t_U(e^A)\|_2 = \max_{1 \leq k \leq n} \frac{[UW^* \text{diag}(e^{2\lambda_1}, e^{2\lambda_2}, \ldots, e^{2\lambda_n})WU^*]_{kk}}{[(UW^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n})WU^*)_{kk}]} \]
\[ \leq \min_{1 \leq k \leq n} \frac{[UW^* \text{diag}(e^{2\lambda_1}, e^{2\lambda_2}, \ldots, e^{2\lambda_n})WU^*]_{kk}}{([UW^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n})WU^*)_{kk}]} \leq \frac{e^{2\lambda_{\text{max}}(A)}}{e^{\lambda_{\text{min}}(A)}} = e^{2\lambda_{\text{max}}(A) - \lambda_{\text{min}}(A)}. \]
Moreover, we get by (2.2) and Lemma 2.1,
\[ \|t_U(e^A)\|_2 \geq \max_{1 \leq k \leq n} \frac{[UW^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n})WU^*]_{kk}}{([UW^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n})WU^*)_{kk}]} \]
\[ \geq \max_{1 \leq k \leq n} [(UW^* \text{diag}(e^{\lambda_1}, e^{\lambda_2}, \ldots, e^{\lambda_n})WU^*)_{kk}] \geq e^{\lambda_{\text{min}}(A)}. \]
Theorem 2.3. Let $A \in \mathbb{C}^{n \times n}$ with $\gamma_k$ and $\eta_k$ given by (2.3). If both $A$ and $c_U(A)$ are nonsingular, then we have

$$\|e^{t_U(A)}\|_2 = \max_{1 \leq k \leq n} \left| e^{\frac{-\eta_k t}{n}} \right|.$$ 

Proof. We have by (2.4),

$$\|e^{t_U(A)}\|_2 = \left\| U^* \text{diag} \left( e^{\frac{-\eta_1 t}{n}}, e^{\frac{-\eta_2 t}{n}}, \ldots, e^{\frac{-\eta_n t}{n}} \right) U \right\|_2 = \max_{1 \leq k \leq n} \left| e^{\frac{-\eta_k t}{n}} \right|.$$ 

\[\square\]

For the determinants of $e^A$ and $e^{t_U(A)}$, we have the following results.

Lemma 2.4. [1, p.78][3, p.648] For $A \in \mathbb{C}^{n \times n}$,

$$\det(e^A) = \exp[\text{tr}(A)].$$

Theorem 2.5. Let $A \in \mathbb{C}^{n \times n}$ with $\gamma_k$ and $\eta_k$ given by (2.3). If both $A$ and $c_U(A)$ are nonsingular, then we have

$$\det(e^{t_U(A)}) = \exp \left[ \sum_{k=1}^n \frac{\gamma_k}{\eta_k} \right].$$

If $A$ is Hermitian positive definite, then

$$\det(e^{t_U(A)}) \geq \det(e^A).$$

Proof. We have by Lemma 2.4,

$$\det(e^{t_U(A)}) = \exp \left[ \text{tr}(t_U(A)) \right] = \exp \left[ \text{tr}(U^* \delta(UAA^*U^*) \delta^{-1}(UA^*U^*) U) \right]$$

$$= \exp \left[ \text{tr}(\delta(UAA^*U^*) \delta^{-1}(UA^*U^*)) \right] = \exp \left[ \sum_{k=1}^n \frac{\gamma_k}{\eta_k} \right].$$

If $A$ is Hermitian positive definite, then by Lemma 1.1 (v),

$$\det(e^{t_U(A)}) = \exp \left[ \text{tr}(\delta(UAA^*U^*) \delta^{-1}(UA^*U^*)) \right]$$

$$= \exp \left[ \sum_{k=1}^n \frac{[UAA^*U^*]_{kk}}{[UA^*U^*]_{kk}} \right] = \exp \left[ \sum_{k=1}^n \frac{[UAA^*U^*]_{kk} \cdot [UA^*U^*]_{kk}}{[UA^*U^*]_{kk} \cdot [UA^*U^*]_{kk}} \right]$$

$$\geq \exp \left[ \sum_{k=1}^n [UAU^*]_{kk} \right] = \exp \left[ \sum_{k=1}^n \lambda_k(UAU^*) \right] = \exp \left[ \sum_{k=1}^n \lambda_k(A) \right]$$

$$= \exp[\text{tr}(A)] = \det(e^A),$$

where $\lambda_k(E)$ denotes the $k$th eigenvalue of the matrix $E$ for $k = 1, \ldots, n.$

\[\square\]
Before the end of section 2.1, we discuss the Kronecker product and sum of the matrix exponential.

**Definition 2.6.** [12, p.331] The Kronecker product of $A = [a_{ij}] \in \mathbb{C}^{m \times n}$ and $B \in \mathbb{C}^{p \times q}$ is defined by

$A \otimes B = [a_{ij}B] \in \mathbb{C}^{mp \times nq}$.

The Kronecker sum of $A \in \mathbb{C}^{n \times n}$ and $B \in \mathbb{C}^{m \times m}$ is defined by

$A \oplus B = A \otimes I_m + I_n \otimes B$.

Let $U$ be an $n \times n$ unitary matrix and $V$ be an $m \times m$ unitary matrix. We first recall the following lemma on the operator $c_{U \otimes V}$.

**Lemma 2.7.** [16, Theorem 2.3] For $A \in \mathbb{C}^{n \times n}$ and $B \in \mathbb{C}^{m \times m}$, we have

$c_{U \otimes V}(A \otimes B) = c_U(A) \otimes c_V(B)$.

On the operator $t_{U \otimes V}$, we have the following theorem.

**Theorem 2.8.** Let $A \in \mathbb{C}^{n \times n}$ and $B \in \mathbb{C}^{m \times m}$. If $A$, $B$, $c_U(A)$, and $c_V(B)$ are nonsingular, then we have

$t_{U \otimes V}(A \otimes B) = t_U(A) \otimes t_V(B)$.

**Proof.** By using Lemma 2.7, we have

$$
t_{U \otimes V}(A \otimes B) = c_{U \otimes V}((A \otimes B)(A \otimes B)^*) [c_{U \otimes V}((A \otimes B)^*)]^{-1}
= c_{U \otimes V}(AA^* \otimes BB^*) [c_{U \otimes V}(A^* \otimes B^*)]^{-1}
= (c_U(AA^*) \otimes c_V(BB^*)) [c_U(A^*) \otimes c_V(B^*)]^{-1}
= (c_U(AA^*)[c_U(A^*)]^{-1}) \otimes (c_V(BB^*)[c_V(B^*)]^{-1})
= t_U(A) \otimes t_V(B).
$$

\[ \square \]

We recall the following results on the Kronecker product and sum of the matrix exponential.

**Lemma 2.9.** [12, p.237][3, p.755] Let $A \in \mathbb{C}^{n \times n}$ and $B \in \mathbb{C}^{m \times m}$. Then

$$e^A \otimes I = e^A \otimes I, \quad e^I \otimes B = I \otimes e^B, \quad e^{A \otimes B} = e^A \otimes e^B, \quad \text{tr}(e^{A \otimes B}) = \text{tr}(e^A) \cdot \text{tr}(e^B).$$

Then we have the following theorem for the superoptimal preconditioners of the matrix exponential.
Theorem 2.10. Let \( A \in \mathbb{C}^{n \times n} \) and \( B \in \mathbb{C}^{m \times m} \). If \( A, B, c_U(A), \) and \( c_V(B) \) are nonsingular, then we have

(i) \( t_{U \otimes V}(e^{A \otimes B}) = t_U(e^A) \otimes t_V(e^B), \quad e^{t_{U \otimes V}(A \otimes B)} = e^{t_U(A) \otimes t_V(B)}. \)

(ii) \( \text{tr}(t_{U \otimes V}(e^{A \otimes B})) = \sum_{k=1}^{n} (\alpha_k/\bar{\beta}_k) \cdot \sum_{k=1}^{m} (\zeta_k/\bar{\xi}_k), \) where

\[
\delta(Ue^A e^{A^*} U^*) = \text{diag}(\alpha_1, \alpha_2, \ldots, \alpha_n), \quad \delta(Ue^A U^*) = \text{diag}(\beta_1, \beta_2, \ldots, \beta_n),
\]

\[
\delta(Ve^B e^{B^*} V^*) = \text{diag}(\zeta_1, \zeta_2, \ldots, \zeta_m), \quad \delta(Ve^B V^*) = \text{diag}(\xi_1, \xi_2, \ldots, \xi_m).
\]

Proof. The proof of (i) follows directly from Theorem 2.8 and Lemma 2.9. For the equality of (ii), we have by Lemma 1.1 (ii),

\[
\text{tr}(t_{U \otimes V}(e^{A \otimes B})) = \text{tr}(t_U(e^A) \otimes t_V(e^B)) = \text{tr}(t_U(e^A)) \cdot \text{tr}(t_V(e^B))
\]

\[
= \text{tr}(U^* \delta(Ue^{A^*} U^*) \delta^{-1}(U(e^{A^*} U^*) U) \cdot \text{tr}(V^* \delta(Ve^{B^*} V^*) \delta^{-1}(Ve^{B^*} V^*) V)
\]

\[
= \sum_{k=1}^{n} (\alpha_k/\bar{\beta}_k) \cdot \sum_{k=1}^{m} (\zeta_k/\bar{\xi}_k).
\]

\[ \square \]

2.2 Superoptimal preconditioners for matrix cosine and matrix sine

The matrix cosine and matrix sine are defined for \( A \in \mathbb{C}^{n \times n} \) by

\[
\cos(A) \equiv I - \frac{A^2}{2!} + \frac{A^4}{4!} - \frac{A^6}{6!} + \cdots,
\]

and

\[
\sin(A) \equiv A - \frac{A^3}{3!} + \frac{A^5}{5!} - \frac{A^7}{7!} + \cdots.
\]

Since

\[ e^{iA} = \cos(A) + i \sin(A), \quad i \equiv \sqrt{-1}, \]

we have

\[ \cos(A) = \frac{e^{iA} + e^{-iA}}{2}, \quad \sin(A) = \frac{e^{iA} - e^{-iA}}{2i}. \quad (2.6) \]

Note that

\[
U \cos(A) U^* = U \left( I - \frac{1}{2!} A^2 + \frac{1}{4!} A^4 - \frac{1}{6!} A^6 + \cdots \right) U^*
\]

\[
= I - \frac{B^2}{2!} + \frac{B^4}{4!} - \frac{B^6}{6!} + \cdots = \cos(B),
\]

\[ 8 \]
where $B = UA^*$. If both $A$ and $c_U(A)$ are nonsingular, then $t_U(\cos(A))$ is given by Lemma 1.1 (ii),

$$t_U(\cos(A)) = U^* \delta(U \cos(A) \cos(A)^* U^*) \delta^{-1}(U \cos(A)^* U^*) U$$

$$= U^* \delta(U \cos(A)U^*U \cos(A)^* U^*) \delta^{-1}(U \cos(A)^* U^*) U$$

$$= U^* \delta(\cos(B) \cos(B)^*) \delta^{-1}(\cos(B)^*) U.$$  

Similarly, we have

$$t_U(\sin(A)) = U^* \delta(\sin(B) \sin(B)^*) \delta^{-1}(\sin(B)^*) U.$$  

We see from (2.6) that, if $B$ is very sparse, one may compute $\cos(B)$ and $\sin(B)$ easily since $e^B$ can be computed readily.

Moreover, if $A$ is Hermitian, then there exists a unitary matrix $W$ such that $A = W^* \Lambda W$ where $\Lambda = \text{diag}(\lambda_1, \lambda_2, \ldots, \lambda_n)$. As we did in the case of matrix exponential, one can obtain

$$t_U(\cos(A)) = U^* \delta(UW^* \text{diag}(\cos^2(\lambda_1), \cos^2(\lambda_2), \ldots, \cos^2(\lambda_n)) W U^*) \times$$

$$\delta^{-1}(UW^* \text{diag}(\cos(\lambda_1), \cos(\lambda_2), \ldots, \cos(\lambda_n)) W U^*) U,$$

and similarly

$$t_U(\sin(A)) = U^* \delta(UW^* \text{diag}(\sin^2(\lambda_1), \sin^2(\lambda_2), \ldots, \sin^2(\lambda_n)) W U^*) \times$$

$$\delta^{-1}(UW^* \text{diag}(\sin(\lambda_1), \sin(\lambda_2), \ldots, \sin(\lambda_n)) W U^*) U.$$

Again, let $\gamma_k$ and $\eta_k$ be given by (2.3). For preconditioners $\cos(t_U(A))$ and $\sin(t_U(A))$, we have

$$\cos(t_U(A)) = U^* \text{diag}(\cos(\frac{2\gamma_1}{\eta_1}), \cos(\frac{2\gamma_2}{\eta_2}), \ldots, \cos(\frac{2\gamma_n}{\eta_n})) U,$$

and

$$\sin(t_U(A)) = U^* \text{diag}(\sin(\frac{2\gamma_1}{\eta_1}), \sin(\frac{2\gamma_2}{\eta_2}), \ldots, \sin(\frac{2\gamma_n}{\eta_n})) U.$$  

Now, we study norm bounds of $t_U(\cos(A))$ and $t_U(\sin(A))$.

**Theorem 2.11.** Let $A \in \mathbb{C}^{n \times n}$ be Hermitian with eigenvalues $\{\lambda_k\}_{k=1}^n$. Suppose that both $A$ and $c_U(A)$ are nonsingular. Then we have

(i) If $-\pi/2 \leq \lambda_k \leq \pi/2$ for $k = 1, \ldots, n$, then

$$\max_{1 \leq k \leq n} \cos(\lambda_k) \leq \|t_U(\cos(A))\|_2 \leq \frac{\max_{1 \leq k \leq n} \cos^2(\lambda_k)}{\min_{1 \leq k \leq n} \cos(\lambda_k)}.$$  

9
If \( 0 \leq \lambda_k \leq \pi \) for \( k = 1, \ldots, n \), then

\[
\max_{1 \leq k \leq n} \sin(\lambda_k) \leq \|t_U(\sin(A))\|_2 \leq \frac{\max_{1 \leq k \leq n} \sin^2(\lambda_k)}{\min_{1 \leq k \leq n} \sin(\lambda_k)}.
\]

**Proof.** The proof follows from Theorem 2.2. \( \square \)

For norm bounds of \( \cos(t_U(A)) \) and \( \sin(t_U(A)) \), we have the following theorem. The proof of the theorem is straightforward.

**Theorem 2.12.** Let \( A \in \mathbb{C}^{n \times n} \). If both \( A \) and \( c_U(A) \) are nonsingular, then we have

\[
\| \cos(t_U(A)) \|_2 = \max_k \left| \cos \left( \frac{\gamma_k}{\eta_k} \right) \right|, \quad \| \sin(t_U(A)) \|_2 = \max_k \left| \sin \left( \frac{\gamma_k}{\eta_k} \right) \right|,
\]

where \( \gamma_k \) and \( \eta_k \) are given by (2.3).

We now recall the following results on the Kroneker product.

**Lemma 2.13.** [12, p.288] Let \( A \in \mathbb{C}^{n \times n} \) and \( B \in \mathbb{C}^{m \times m} \). Then

\[
\cos(A \otimes I) = \cos(A) \otimes I, \quad \cos(I \otimes B) = I \otimes \cos(B),
\]

\[
\sin(A \otimes I) = \sin(A) \otimes I, \quad \sin(I \otimes B) = I \otimes \sin(B).
\]

Hence, based on Theorem 2.8, we can easily establish the following theorem for the superoptimal preconditioners of matrix cosine and matrix sine.

**Theorem 2.14.** Let \( A \in \mathbb{C}^{n \times n} \) and \( B \in \mathbb{C}^{m \times m} \). If \( A, B, c_U(A), \) and \( c_V(B) \) are nonsingular, then we have

\[
t_{U \otimes V}(\cos(A \otimes I)) = t_U(\cos(A)) \otimes I, \quad \cos(t_{U \otimes V}(A \otimes I)) = \cos(t_U(A)) \otimes I,
\]

\[
t_{U \otimes V}(\sin(A \otimes I)) = t_U(\sin(A)) \otimes I, \quad \sin(t_{U \otimes V}(A \otimes I)) = \sin(t_U(A)) \otimes I,
\]

\[
t_{U \otimes V}(\cos(I \otimes B)) = I \otimes t_V(\cos(B)), \quad \cos(t_{U \otimes V}(I \otimes B)) = I \otimes \cos(t_V(B)),
\]

\[
t_{U \otimes V}(\sin(I \otimes B)) = I \otimes t_V(\sin(B)), \quad \sin(t_{U \otimes V}(I \otimes B)) = I \otimes \sin(t_V(B)).
\]

### 2.3 Superoptimal preconditioners for matrix logarithm

In this section we discuss the matrix logarithm:

\[
\log(I + A) \equiv A - \frac{A^2}{2} + \frac{A^3}{3} - \frac{A^4}{4} + \cdots, \quad \rho(A) < 1,
\]

where \( \rho(A) \) is the spectral radius of matrix \( A \).
We observe that
\[
U \log(I + A) U^* = U \left( A - \frac{A^2}{2} + \frac{A^3}{3} - \frac{A^4}{4} + \cdots \right) U^* \\
= B - \frac{B^2}{2} + \frac{B^3}{3} - \frac{B^4}{4} + \cdots = \log(I + B), \quad \rho(B) < 1,
\]
where \( B = U A U^* \). If both \( A \) and \( c_U(A) \) are nonsingular, then we have
\[
t_U(\log(I + A)) = U^* \delta \left( \log(I + B) \right) \delta^{-1} \left( \left[ \log(I + B) \right]^* U, \quad \rho(B) < 1.
\]

Similarly, if \( A \) is Hermitian, then there exists a unitary matrix \( W \) such that \( A = W \Lambda W^* \)
where \( \Lambda = \text{diag}(\lambda_1, \lambda_2, \ldots, \lambda_n) \) with \( |\lambda_k| < 1 \) for any \( k \). As we did in sections 2.1 and 2.2, we could obtain
\[
t_U(\log(I + A)) = U^* \delta \left( U W^* \text{diag} \left( \log^2(1 + \lambda_1), \log^2(1 + \lambda_2), \ldots, \log^2(1 + \lambda_n) \right) W U^* \right) \times \\
\delta^{-1} \left( U W^* \text{diag} \left( \log(1 + \lambda_1), \log(1 + \lambda_2), \ldots, \log(1 + \lambda_n) \right) W U^* \right) U.
\]

Furthermore, for the preconditioner \( \log(I + t_U(A)) \), again let \( \gamma_k \) and \( \eta_k \) be given by (2.3). When \( A \) is Hermitian with \( \rho(A) < 1 \) and \( \gamma_k / |\eta_k| < 1 \) for any \( k \), we have
\[
\log(I + t_U(A)) = U^* \text{diag} \left( \log \left( 1 + \frac{\gamma_1}{\eta_1} \right), \log \left( 1 + \frac{\gamma_2}{\eta_2} \right), \ldots, \log \left( 1 + \frac{\gamma_n}{\eta_n} \right) \right) U. \quad (2.7)
\]

Thus we immediately have the following theorem by using (2.7).

**Theorem 2.15.** Let \( A \in \mathbb{C}^{n \times n} \) be Hermitian with \( \rho(A) < 1 \) and let \( \gamma_k \) and \( \eta_k \) be given by (2.3). If \( \gamma_k / |\eta_k| < 1 \) for any \( k \), then we have
\[
\| \log(I + t_U(A)) \|_2 = \max_{1 \leq k \leq n} \left| \log \left( 1 + \frac{\gamma_k}{\eta_k} \right) \right|.
\]

### 3 Numerical experiments

In this section, we solve a system of matrix function \( f(A)x = b \). We propose the preconditioned conjugate gradient (PCG) method with two superoptimal preconditioners \( t_U(f(A)) \) and \( f(t_U(A)) \). We discuss the cost for constructing preconditioners and report some numerical results.

#### 3.1 Cost of constructing preconditioners

We compare the computational cost of constructing two superoptimal preconditioners \( t_U(f(A)) \) and \( f(t_U(A)) \) for the matrix function \( f(A) \). By Lemma 1.1 (ii), for different matrix functions \( f \), we get
\[
t_U(f(A)) = U^* \delta(U f(A) f(A)^* U^*) \delta^{-1} (U f(A)^* U^*) U,
\]
and

\[ f(t_U(A)) = U^* f(\delta(UAA^*U^*)\delta^{-1}(UA^*U^*))U. \]

Given a general unitary matrix \( U \) and the matrix \( f(A) \), it needs \( \mathcal{O}(n^3) \) operations for constructing \( t_U(f(A)) \) and \( f(t_U(A)) \). Moreover, the matrix-vector products \([t_U(f(A))]^{-1}y \) and \([f(t_U(A))]^{-1}y \) require \( \mathcal{O}(n^3) \) operations, where \( y \) is an \( n \)-vector.

When \( U \) is the \( n \times n \) Fourier matrix \( F \), \( t_F(A) \), \( t_F(f(A)) \), and \( f(t_F(A)) \) are all circulant matrices. Thus the construction of both \( t_F(f(A)) \) and \( f(t_F(A)) \) requires \( \mathcal{O}(n^2 \log n) \) operations for general matrices \( A \) [5]. Then the matrix-vector products \([t_F(f(A))]^{-1}y \) and \([f(t_F(A))]^{-1}y \) need \( \mathcal{O}(n \log n) \) operations by using the fast Fourier transforms (FFTs) [4, 5, 13].

Let the matrix \( A \) be the \( n \times n \) Toeplitz matrix \( T_n \) given by:

\[
T_n = \begin{pmatrix}
t_0 & t_{-1} & \cdots & t_{-n} & t_{1-n} \\
t_1 & t_0 & \cdots & t_{-2} & t_{2-n} \\
\vdots & t_1 & \cdots & t_0 & \vdots \\
t_{n-2} & \cdots & \cdots & t_1 & t_{1-n} \\
t_{n-1} & t_{n-2} & \cdots & t_{2-n} & t_0 
\end{pmatrix}
\]

Suppose that the diagonals \( \{t_k\}_{k=-n+1}^{n-1} \) of \( T_n \) are the Fourier coefficients of a function \( g \), i.e.,

\[
t_k(g) = \frac{1}{2\pi} \int_{-\pi}^{\pi} g(x)e^{-ikx} dx.
\]

Then \( g \) is called the generating function of \( T_n(g) \) for \( 1 \leq n < \infty \) [13, p.19]. If \( g \) is a real-valued function defined on \([-\pi, \pi]\), then the Toeplitz matrix \( T_n(g) \) is Hermitian. By using Theorem 1.21 in [13, p.20], we get

\[
g_{\min} \leq \lambda_{\min}(T_n(g)) \leq \lambda_{\max}(T_n(g)) \leq g_{\max},
\]

where \( g_{\min}, g_{\max}, \lambda_{\min}(\cdot), \) and \( \lambda_{\max}(\cdot) \) denote the minimum and maximum values of \( g \) on \([-\pi, \pi]\) and the smallest and largest eigenvalues respectively. Moreover, from Theorem 1.13 in [12, p.10], it follows that the eigenvalues of \( f(T_n) \) are given by \( \{f(\lambda_k)\}_{k=1}^{n} \), where \( \lambda_k, k = 1, \ldots, n, \) are the eigenvalues of \( T_n(g) \). Thus,

\[
f_{\min} \leq \lambda_{\min}(f(T_n)) \leq \lambda_{\max}(f(T_n)) \leq f_{\max}, \tag{3.1}
\]

where \( f_{\min} \) and \( f_{\max} \) denote the minimum and maximum values of \( f \) on \([g_{\min}, g_{\max}]\) respectively. For the matrix function \( f(T_n) \), it follows that the construction of both \( t_F(f(T_n)) \) and \( f(t_F(T_n)) \) only requires \( \mathcal{O}(n \log n) \) operations [5]. The matrix-vector products \([t_F(f(T_n))]^{-1}y \) and \([f(t_F(T_n))]^{-1}y \) require \( \mathcal{O}(n \log n) \) operations by using the FFTs.
3.2 Numerical results

In this section, we report some numerical tests to illustrate the effectiveness of our superoptimal preconditioners $t_F(f(T_n))$ and $f(t_F(T_n))$ for solving the system

$$f(T_n)x = b$$

(3.2)

by using the PCG method. We compute the matrix functions $f(T_n)$ by the built-in function \texttt{funm}. For the Toeplitz matrix exponential, the matrix-vector product $\exp(T_n)x$ can be calculated efficiently by a fast algorithm provided in [18]. By (2.6), we know that $\cos(A)x$ and $\sin(A)x$ can be computed fast. Let the $n$-vector $b$ be generated randomly, i.e., $b = \texttt{randn}(n)$. For comparison purposes, we solve the system (3.2) by the built-in function \texttt{pcg} without preconditioner, with the preconditioners $c_F(f(T_n))$, $f(c_F(T_n))$, $t_F(f(T_n))$, or $f(t_F(T_n))$. Here $c_F(f(T_n))$ and $f(c_F(T_n))$ are the optimal preconditioners discussed in [16]. Then we compare the performance of these different preconditioners. In our numerical experiments, we set the largest number of the PCG iterations to be $3 \times 10^4$ and the PCG method is stopped when

$$\frac{\|f(T_n)x - b\|}{\|b\|} < 10^{-6}. $$

All the numerical tests are carried out by using \texttt{MATLAB} 2010a on a personal computer of 2.0 GHz CPU and 1GB RAM. We repeat our experiments for 10 different random vectors $b$. In what follows, ‘\texttt{cputime}’, ‘\texttt{IT.}’, ‘\texttt{Res.}’, and ‘\texttt{Cond.}’ mean the averaged total CPU time in seconds, the averaged number of the PCG iterations, the averaged relative residual at the final iterate of the algorithm with proposed preconditioners, and the condition numbers of the matrices $f(T_n)$, respectively. We also use I, II, III, VI, and V to denote the PCG method without preconditioner, with $c_F(f(T_n))$, $f(c_F(T_n))$, $t_F(f(T_n))$, and $f(t_F(T_n))$, respectively.

Example 3.1. We consider the matrix cosine $\cos(T_n)$ for different $n$, where the Toeplitz matrices $T_n$ are generated by the function $g(x) = \frac{2}{\pi} \cos(0.25x)$.

Example 3.2. We consider the matrix sine $\sin(T_n)$ for different $n$, where the Toeplitz matrices $T_n$ are generated by the function $g(x) = \pi \cos(0.1x)$.

Example 3.3. We consider the matrix logarithm $\log(I + T_n)$ for different $n$, where the Toeplitz matrices $T_n$ are generated by the function $g(x) = \frac{1}{2} \cos(x) + \frac{1}{2}$.

Tables 1–3 list the numerical results for Examples 3.1–3.3. We observe from Tables 1–3 that our proposed superoptimal preconditioners $t_F(f(T_n))$ and $f(t_F(T_n))$ can effectively reduce the number of iterations and then improve the performance of the PCG method. We also note that the proposed superoptimal preconditioners $t_F(f(T_n))$ and $f(t_F(T_n))$ work a little bit worse than the optimal preconditioners $c_F(f(T_n))$ and $f(c_F(T_n))$ for some examples (see Table 1 (VI), Table 2 (VI), and Table 3 (VI,V)).

Acknowledgement The authors would like to thank Mr. Zhao Zhi for discussion on the problems in this paper.
